EMBEDDED / ELECTRONICS / ROBOTICS

CUSTOM AUTONOMOUS DRONE

PROJECT 01

Real hardware, firmware and autonomy in one system.

A real end to end autonomous aircraft combining mechanical design, PCB engineering, embedded flight control, sensing, telemetry and an operator application.

● EXISTING BUILD / EVIDENCE TO CURATE

SYSTEM / RESEARCH ARCHITECTURE

1 STAGE
Airframe & power

→

2 STAGE
Flight firmware

→

3 STAGE
State estimation & control

→

4 STAGE
Vision / telemetry / app

THE PROBLEM TO SOLVE

How do separately designed power, airframe, control and software subsystems become one verifiable flying system?

TECHNICAL DISTINCTION

1. Document the original build from real artefacts rather than retrospective marketing copy.
2. Separate what was actually tested on hardware from what existed in simulation or concept form.

WHAT THE EVIDENCE MUST SHOW

- ✓ Architecture traceability from source to subsystem diagram
- ✓ Clear distinction between verified historical evidence and later reconstruction
- ✓ Technical narrative explaining the major engineering tradeoffs
