AI ENGINEERING / APPLIED AI

PROOF AI

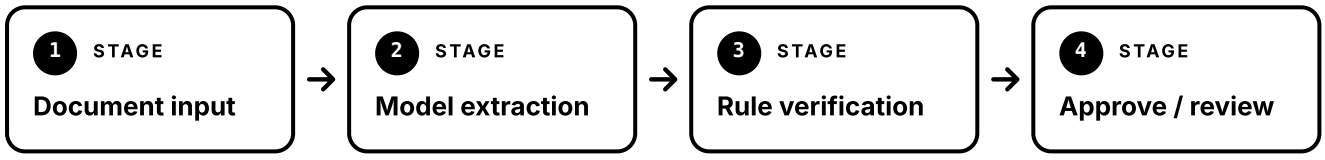

PROJECT 04

AI that can be challenged, checked and audited.

A verifiable AI workflow that separates probabilistic document interpretation from deterministic financial controls and explicit human review.

PROPOSED RESEARCH / NOT YET VERIFIED

SYSTEM / RESEARCH ARCHITECTURE

THE PROBLEM TO SOLVE

How much incorrect automated acceptance can independent checks and abstention prevent without making automation impractical?

TECHNICAL DISTINCTION

1. This should solve a trust problem, not just showcase another extraction pipeline.
2. The research value lies in what deterministic controls catch, what they miss and how review thresholds affect throughput.

WHAT THE EVIDENCE MUST SHOW

- False automatic accept rate vs human review volume
- Extraction precision/recall and confidence calibration
- Examples of errors that pass every deterministic rule
