FREIGHT INVOICE AUDIT

PROJECT 08

Every carrier invoice checked against what was agreed.

A proposed audit engine that recalculates carrier invoices from contract rates, fuel surcharges, accessorials and delivery events then reports exact overcharges with evidence.

PROPOSED RESEARCH / NOT YET VERIFIED

SYSTEM / RESEARCH ARCHITECTURE

1 STAGE
Invoice intake

→

2 STAGE
Contract rating

→

3 STAGE
Delivery events

→

4 STAGE
Finance review

THE PROBLEM TO SOLVE

How much of a carrier overcharge can deterministic recalculation find and prove without raising disputes that finance would reject?

TECHNICAL DISTINCTION

1. The aim is an exact, explainable overcharge per line with evidence, not a vague anomaly score.
2. A finance person decides which disputes to raise; the system only recommends and documents.

WHAT THE EVIDENCE MUST SHOW

- ✓ Overcharge found vs injected truth on synthetic invoices
- ✓ False dispute rate and unexplained variance by cause
- ✓ Examples where rate cards are ambiguous or contradictory
