AI ENGINEERING / EVALUATION / TESTING

WORKFLOW EVALUATION HARNESS

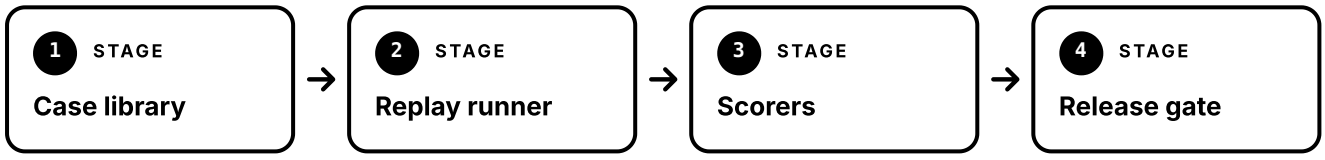

PROJECT 12

A test bench that gates AI workflow changes before release.

A reusable test bench that replays synthetic workflow cases through an AI assisted pipeline and scores accuracy, latency, cost and failure modes before any release.

PROPOSED RESEARCH / NOT YET VERIFIED

SYSTEM / RESEARCH ARCHITECTURE

THE PROBLEM TO SOLVE

Can a repeatable replay harness with regression gates catch harmful AI workflow changes before they reach a live process?

TECHNICAL DISTINCTION

1. Most AI changes are judged by a few hand picked examples. This replaces that habit with versioned cases and fixed pass criteria.
2. The harness underpins the other commercial workflow projects so each one shares one disciplined route to release.

WHAT THE EVIDENCE MUST SHOW

- Regression detection rate on deliberately injected defects
- Run to run score variance on identical cases
- Cost and latency per case with confidence intervals
